### Homework 3

#### Fully calibrated

The image seems to reconstruct to its original shape, which is a cube. The image shows the cube in an edge view. I don't believe there is room for ambiguity since it's clear that the image reflects a cube.

#### Only corresponding point pairs

The image seems to take the shape of a rectangle rather than a cube. The cube seems to be elongated. The image shows the cube from a top tilted view. There is uncertainty in the image since the image does appear to be stretched out. Therefore, it is unclear if the original object had a smaller width.

#### Only K

The image seems to reconstruct it true to its original shape, which is a cube. The image shows the cube in a frontal view. Just like in the fully calibrated case, the image leaves little room for ambiguity since it's clear that the image represents a cube.
